## **TB Testing for People Living with HIV**

[Announcer] This program is presented by the Centers for Disease Control and Prevention.

So if you're HIV infected, make sure you ask your doctor to test you for tuberculosis. We have a skin test *and* a blood test, both of which *would* detect the presence of latent tuberculosis, and if you do have that, we have treatment that could be given to prevent you from ever developing disease.

If, on the other hand, you have symptoms, such as cough, weight loss, night sweats, make sure that the doctors think of tuberculosis because if we diagnose it, we can cure it.
